FAULTLINE

KNOWLEDGE BASE · RAG / CHATBOT SOURCE DOCUMENT

Generated 2026-09-09 · v1 · owner: ianrussel537@gmail.com

> *Internal source document for a customer-facing RAG chatbot. Update this file whenever the product, pricing, or roadmap changes — a chatbot built on it is only as accurate as what's written here. "Faultline" is a working name pending a possible rename (Leaseline is the front-runner); find-and-replace this doc when that's decided.*

1. What is Faultline?

Faultline is an AI maintenance-triage tool for small property managers and landlords. It reads incoming tenant maintenance requests — texts, emails, whatever's already landing in an inbox — and automatically:

1. Identifies what's actually wrong (the **category**),
2. Judges how urgent it is (the **urgency**),
3. Drafts a professional reply the property manager can send as-is, edit, or escalate to a vendor.

It does not auto-send anything on its own. A person reviews and approves every draft before it goes out.

Who it's for: independent landlords and small property management companies (roughly 2–200 units) who currently triage maintenance requests by hand — reading texts/emails, deciding what's urgent, and typing replies themselves.

Who it's not for: large enterprise property management firms with existing dedicated maintenance-coordination software and staff — Faultline is built for the smaller operators those tools tend to ignore.

Current stage: public beta. It is an independent, solo-developer-built project, not a funded company with a large team.

2. How it works

Step 1 — Forward it in. Paste a tenant’s message, forward the email, or (in a future version) connect an inbox — whatever’s already landing gets routed into Faultline as-is. No special formatting required.

Step 2 — Triaged in about 2 seconds. Faultline returns a category, an urgency level, and a drafted reply. If a single message reports more than one problem, it splits them into separate, individually-triaged sub-issues instead of forcing everything into one label.

Step 3 — You approve, it’s sent. The property manager can send the draft as-is, edit it first, or escalate directly to a vendor. Nothing is sent automatically without a person’s action.

3. Category taxonomy

Faultline classifies each reported issue into one of eight categories:

CATEGORY	COVERS
Plumbing	Leaks, clogs, water heaters, low/no water pressure, running toilets
Electrical	Outlets, breakers, lighting, wiring issues, sparking/burning smells
HVAC	Heating, air conditioning, thermostats, vents, furnaces
Appliance	Stoves, fridges, dishwashers, washers/dryers, garbage disposals
Pest	Insects, rodents, wasp nests, general infestation reports
Structural	Doors, windows, walls, ceilings, railings, locks
Noise	Neighbor noise, unexplained building sounds, alarms
General	Anything that doesn’t fit the above — mailboxes, gates, intercoms, etc.

A single tenant message can contain issues from more than one category (e.g. a leak *and* a broken light) — Faultline reports each one separately rather than picking just one label for the whole message.

4. Urgency levels

Faultline assigns one of four urgency levels **per issue**, not per message:

- **Emergency** — immediate safety or property-damage risk: gas smells, active flooding/burst pipes, no heat in freezing weather, sparking outlets, broken exterior locks. Faultline recommends same-day dispatch.
- **High** — significant but not immediately dangerous: no hot water, a fridge that’s stopped cooling, a growing ceiling water stain. Recommended response window: within 24 hours.
- **Medium** — needs attention but can wait a few days: a running toilet, a jammed disposal, a loose railing, minor pest sightings.
- **Low** — routine, can be handled on the next regular visit: a burned-out hallway bulb, a dripping outdoor spigot, general noise complaints.

Urgency is a *recommendation* based on the wording of the message. The property manager always makes the final call and can override it before sending or dispatching.

5. Pricing

During the beta: free. No credit card required to join.

Planned pricing after beta (subject to change as the product develops — always quote current pricing from the live site, not this document, if there's ever a mismatch): plans starting at $29/month for up to 100 triaged tickets, with no per-unit fees and no setup cost.

Beta users: anyone who joins during the beta period locks in that introductory ("founder") pricing for as long as they stay subscribed after the beta ends.

There is no long-term contract. Cancel anytime; there's no cancellation fee structure yet published because the product hasn't left beta.

6. Getting started

1. Join the beta waitlist on the landing page (name, email, roughly how many units you manage, and how you currently handle maintenance requests).
2. Beta requests are reviewed in the order they arrive; expect an email within a few days when a spot opens, not instant access.
3. Once in, paste or forward a maintenance message to see it triaged — no integration or software installation is required to try it.

7. Data handling and privacy

Faultline processes the text of maintenance messages submitted to it (by paste, forward, or future inbox connection) in order to generate the category, urgency, and draft reply. That text, along with the resulting tickets, is stored so the property manager can review their history.

Being direct about what this is and isn’t, since prospects will ask:

- This is an independent, beta-stage project — not a large company with a dedicated security or compliance team.
- There is currently no third-party security certification (e.g. SOC 2) and no formal compliance program (e.g. GDPR/CCPA processes) in place. If that’s a hard requirement for a prospective customer, beta is not yet the right stage for them, and they should say so rather than assume compliance that hasn’t been established.
- Property managers should avoid pasting highly sensitive personal data (SSNs, financial account numbers, etc.) into a maintenance request — none of that is needed to triage a plumbing or electrical issue.
- Questions about data handling should go to the contact email in Section 10 rather than being answered by assumption.

8. Integrations and roadmap

Available today: paste-in or forward-in of a maintenance message through the Faultline dashboard.

Not available yet — do not claim these as current features:

- Direct inbox auto-forwarding/connection
- Integration with property management platforms (e.g. Buildium, AppFolio, Propertyware, or similar)
- A mobile app
- SMS/text-message auto-ingestion
- Multi-user team accounts / role-based permissions

These are reasonable directions the product may grow into, but as of this document's writing none of them exist. If a prospect asks about a specific integration not listed here as available, the honest answer is "not yet — it's not built" rather than a vague "yes" or invented timeline.

9. Known limitations

- The AI's category and urgency calls can be wrong, especially on ambiguous or unusually-worded messages. That's why every draft goes through a human review step before sending — it's a drafting assistant, not an autonomous decision-maker.
- It currently handles English-language text messages; it has not been tested on other languages.
- It's a beta product built and maintained by one developer — support response times reflect that (see Section 10), not a staffed support team.

10. Support and contact

For account issues, billing questions, feedback, or anything not covered in this document:
ianrussel537@gmail.com

Because this is a solo-developer beta project, support is not staffed 24/7 — expect a response within a few business days, not instantly.

11. Frequently asked questions

Is this a real, existing company? Faultline is a real product in active beta, built and run by an independent software developer. It is not a large company or a funded startup with a team.

Does Faultline replace my property management software? No. It's a focused tool for one job — triaging maintenance requests and drafting replies. It doesn't handle rent collection, leasing, accounting, or the other things a full property management platform does.

What happens if the AI gets the category or urgency wrong? Every draft is reviewed by the property manager before anything is sent or dispatched — nothing goes out automatically. If a category or urgency looks wrong, the property manager can correct it before acting on it.

Can I edit the drafted reply before it's sent? Yes — the draft can be sent as-is, edited, or the issue can be escalated directly to a vendor instead of sending a tenant reply at all.

Do you integrate with [specific property management software]? Not currently. See Section 8 for what's available today versus what's on the roadmap.

How much does it cost? Free during the beta. See Section 5 for planned post-beta pricing — always confirm current pricing on the live site, since plans can change before the product exits beta.

Is there a contract or minimum commitment? No long-term contract. Cancellation terms beyond that haven't been formally published yet since the product is still in beta.

Is my tenant data secure? See Section 7 for a direct, non-oversold answer — there is currently no formal security certification, and prospects with strict compliance requirements should treat beta as not yet meeting that bar.

How is "urgency" decided? See Section 4 — urgency is assigned per issue based on the wording of the message (e.g. "gas smell" reads as Emergency, "hallway light's been out" reads as Low), and the property manager can always override it.

Can one message report more than one issue? Yes — Faultline splits a message that reports multiple problems into separate tickets, each triaged on its own (see Section 2 and Section 3).

How do I manage more than one property? There is no dedicated multi-property management view in the beta yet; each ticket is tracked individually regardless of how many properties a user manages.

How do I sign up? Join the waitlist from the landing page (Section 6). Beta access is granted in the order requests arrive, not instantly.

Who do I contact with a question this document doesn't answer? ianrussel537@gmail.com (Section 10). Don't guess or invent an answer — say the information isn't available yet and offer to have the developer follow up directly.
